

• BUILT FOR HANDS THAT ARE BUSY

Gloves on. Hands full. Just speak 🗣️.

Speak a goods receipt —
and watch it post as a real
document to **SAP**.

Goods receipt • Stock • Reversal — **SAP OData**

● RECEIVING DOCK · MORNING SHIFT

Lena has both hands under a box.

The pallet landed four minutes ago and it is on no one's books yet. Until that delivery is a document in SAP, the company does not know it owns the goods —

purchasing chases it, production plans without it.

Booking it costs Lena a walk: gloves off, across the floor, to a shared terminal. **Every delivery, every shift.**

● WHAT THIS TOUCHES — AND WHAT IT DOES NOT

A shift is a bundle of tasks.

Lena's morning, task by task. Most of it is not ours to change.

Unload the pallet

UNTOUCHED

Check the packing slip

UNTOUCHED

Set damaged cartons aside

UNTOUCHED

Take the gloves off

GONE

Walk to the shared terminal

Type the material number

GONE

Look up which bin it goes to

AUTOMATIC

Post the goods receipt

BY VOICE

Correct a wrong posting

BY VOICE

Hear the line before it is true

NEW

UNTOUCHED REMOVED DONE BY VOICE NEW TASK

GlovesOn cannot unload the pallet. It removes the **three tasks that exist only because the record lives on a screen** — and adds one worth doing.

● SAY IT. IT POSTS.

One spoken sentence becomes a real document.

YOU "Forty M8 bolts arrived."

GUIDE "Forty pieces of hex bolt M8x40 into bin A-03-02 – confirm?"

YOU "Yes."

→ Material document posted · SAP's released OData API, against a faithful mock S/4HANA · stock moves on screen

Hands never leave the box. The screen is gone from the loop.

● A CONFIRMED WRITE, LIVE

Every number on screen is real.

GLOVESON · PLANT 1000 / RECEIVING · DEMO

CONVERSATION

"Post a goods receipt, forty pieces of forty-seven eleven."

"Forty pieces of hex bolt M8x40 into bin A-03-02 – confirm?"

"Confirm."

YOUR RESULT

Document	4900000123
Material	4711 · Hex Bolt M8x40
Movement	501
Quantity	40 EA → bin A-03-02
Stock	240 → 280

POSTED ✓

The read-back names the **description**, not just the number — which is what lets a worker catch they are holding nuts, not bolts.

The warehouse around this console is staging — you cannot ship a receiving floor to a judge. The scenery is the only fiction; **one environment variable** points the same contract at a real tenant.

Replace with a GIF of the live demo before submitting.

● ASKING IS EASY. FINISHING IS THE HARD PART.

Five guardrails, each one deliberate.

1 The read-back names four things.

Quantity, unit, material description, bin. The description is load-bearing.

2 Nothing posts without a spoken yes.

`execution_mode: hold` — the agent waits for the ERP instead of narrating success.

3 A duplicate is refused.

The same receipt within two minutes is caught — by a guard in the gateway, because real S/4HANA would accept it twice.

4 Nothing is deleted — it is reversed.

A wrong receipt gets a reversal document (102 against a 101). Both stay, because that is what a ledger is.

5 Every document answers why it exists.

Click a posted row: the sentence the worker confirmed, and the second it happened.

● THE AGENT NEVER SEES SAP

One boundary carries every guardrail.

the agent never sees SAP — the gateway owns the write

It speaks in warehouse terms; the gateway owns auth, SAP field translation and every write guardrail. Swapping the mock for a real tenant is **one environment variable** — there is no second code path.

● THE WHOLE VOICE LOOP IS THE VOICE AGENT API

One connection: speech, reasoning, voice, tools.

Streaming **speech-to-text**

LLM routing

Voice output

Turn-taking & VAD

JSON-Schema HTTP tools

execution_mode: hold on both writes

transcription_prompt

56 keyterms → SAP material numbers

Barge-in

Session token minted server-side

Turn detection is pinned (**800 / 2000 ms**) for non-native speakers — adaptive pacing is deliberately off, so we do not claim per-speaker adaptation.

● EVERYONE ELSE VOICE-GUIDES PLANNED WORK

The unplanned pallet has no voice path.

THE INCUMBENTS

Honeywell · Lydia · Ivanti

The WMS issues the task; the worker answers fixed prompts. Decades of it. But a worker cannot *initiate* a document by describing it.

SAP ITSELF

Joule

Posts and reverses goods movements — by **chat**, today. Real-time voice announced for its top cloud tiers, GA planned H2 2026.

GlovesOn is the unplanned moment — by voice, today.

● AN ESTABLISHED BUDGET LINE

Zero per-seat hardware against a \$5,000 norm.

\$4.8–6.5B

voice-directed warehousing today • ~14–17%/yr (analyst estimates, cited as a range)

~\$5,000

incumbent cost per user, hardware + software

\$0.00

GlovesOn per-seat hardware — a browser and a headset. Voice: \$0.075/connected min.

No ROI figure is quoted — session length per receipt is unmeasured (docs/nfr.md §5). market numbers: docs/market.md §4

● NAMED, NOT HIDDEN

What this does not do yet.

- **The ERP is a mock** — the OData contract and the CSRF handshake are real, but no claim is made that this has run against a live tenant.
- **Nobody is authenticated, and the posting is made by a service user** — SAP cannot say who did it. The missing Clean Core piece: principal propagation.
- **Noise robustness is unmeasured** — voice_focus: far-field is set, but a config change is a claim, not a measurement.
- **The demo serves one session at a time**, by design.
- **Turkish is understood on input**, but the agent cannot answer in Turkish yet (TTS support pending).

Naming the gap is the credibility. Every one is written up in the repo, and the judge guide ends with them.

● GLOVESON

It doesn't just stop and ask. It finishes — and leaves a document that can tell you why it exists.
